Building Consents Issued: October 2008

Highlights

- 1,173 new dwelling units were authorised, the lowest monthly total since January 1992.
- 50 new apartment units were authorised, and apart from March 2008, this is the lowest monthly total since April 2000.
- The seasonally adjusted number of new dwelling units, excluding apartments, fell 7.1 percent.
- Residential building consent values totalled \$439 million, down 32 percent compared with October 2007.
- Non-residential building consent values totalled \$348 million, down 14 percent compared with October 2007.

Commentary

Seasonally adjusted series

Movements in the monthly series for seasonally adjusted dwelling numbers for March to June 2008 should be treated with caution. During this period, these series exhibited greater variability than usual. This was due to the high number of dwellings, particularly apartments, authorised in April 2008, and because of the impact of Easter being in March this year instead of April.

Residential buildings

In October 2008, consents were issued for:

- 1,173 new dwelling units, including apartments, the lowest monthly total since January 1992 (when there were 1,166 new dwellings authorised)
- 1,123 new dwellings, excluding apartments
- 50 new apartment units, and apart from March 2008, this is the lowest monthly total since April 2000 (when there were 40 new apartments authorised).

Apartments contributed 4 percent to the number of new dwellings authorised in October 2008, compared with a monthly average of 11 percent for the previous 12 months.

In October 2008, the seasonally adjusted number of authorised new dwellings excluding apartments fell 7.1 percent. When apartments are included, the number fell 22 percent due to the low number of apartments authorised in October 2008.

For the year ended October 2008 compared with the previous October year, the authorised number of:

- new dwellings, including apartments, fell 22 percent
- new dwellings, excluding apartments, fell 24 percent
- apartments fell 6 percent.

New Dwellings Authorised

All regions

Year ended October

The value of authorised residential building consents was \$439 million in October 2008 (a decrease of 32 percent compared with October 2007). The trend has been falling since the peak in June 2007, and is at its lowest level since May 2002.

Value of Residential Buildings Authorised

Including alterations and additions

Monthly

For the year ended October 2008, residential building consents valued at \$6,580 million were issued, a decrease of 15 percent from the October 2007 year.

Regional residential results

In 15 of New Zealand's 16 regions, fewer new dwelling units were authorised in October 2008 than in October 2007; more new dwellings were authorised in Tasman. Numbers fell by 681 units (47 percent) in the North Island and by 233 units (37 percent) in the South Island.

The largest regional decreases were:

- Auckland, down 256 units or 56 percent
- Canterbury, down 193 units or 49 percent.

Non-residential buildings

The value of authorised non-residential building consents was \$348 million in October 2008, a decrease of 14 percent compared with October 2007. Six of the 11 building types recorded decreases in the value of consents compared with October 2007.

For October 2008 compared with October 2007, the largest decreases were:

- hotels and other short-term accommodation, down \$54 million
- offices and administration buildings, down \$25 million
- storage buildings, down \$22 million.

These decreases were partly offset by education buildings, up \$32 million, and hospitals and nursing homes, up \$25 million.

The two largest contributors to the value of consents authorised in October 2008 were offices and administration buildings, at 21 percent, followed by education buildings, at 17 percent.

For the year ended October 2008, non-residential building consents valued at \$4,475 million were issued, an increase of 7.2 percent from the October 2007 year.

All buildings

In October 2008, the value of consents issued for all buildings was \$788 million, a decrease of 25 percent compared with October 2007.

Residential buildings contributed 56 percent to the total value of all buildings in October 2008, while non-residential buildings contributed 44 percent. For the previous 12 months, the average monthly contribution of residential buildings was 60 percent.

Annual Values
Including alterations and additions
Year ended October

Monthly Values
Including alterations and additions

For the year ended October 2008, the total value of consents issued for all buildings was \$11,055 million, down \$892 million (7.5 percent) from the October 2007 year. For the latest year, the value of consents issued for residential buildings fell \$1,192 million (15 percent), while the value for non-residential buildings rose \$301 million (7.2 percent).

Building Consents Issued: November 2008 will be released on 14 January 2009.

Technical notes

Data source

Data for building consents is obtained each month from all territorial authorities. Values include GST and are not inflation adjusted.

Coverage

From September 1989, consents below \$5,000 are excluded. Under the building regulations effective from 1 January 1993, building authorisations are applied for under the building consents system administered by territorial authorities. Before this date, applications were made under the building permits system. The building consents system has wider coverage than the building permits system. The additional coverage includes some government building (particularly work on education buildings), and on-site drainage and reticulation work.

Classification of building types

A building is classified according to its main intended function. Some consents are for a building that may have more than one purpose (such as a shop/office building). Before June 1996, these consents were classified to a separate multi-purpose category. From the June 1996 month, the floor area and value of a consent for a multi-purpose building is split between each of the building's main functions. When sufficient detail cannot be obtained, the building is classified according to the predominant function of the building.

Figures for new apartments are compiled from consents that have 10 or more new attached dwelling units (flats or apartments). If there are fewer than 10 flats or apartments on a consent, they are treated as being dwellings other than apartments. Apartment numbers often show large fluctuations from month to month and, unless removed from dwelling figures, can mask underlying movements.

Staged consents

Some consents, particularly for large projects, are issued in stages across several months. Value data is collected at each stage but floor areas and dwelling or building counts are normally recorded at the first large stage of the project. This difference in timing can affect calculations of average prices.

Seasonally adjusted series

Seasonal adjustment removes the estimated impact of regular seasonal events, such as summer holidays and pre-Christmas purchasing, from statistical series. This makes figures for adjacent periods more comparable. To reduce distortions, the series for non-residential buildings is estimated after removal of large consent values of \$25 million or more.

The seasonally adjusted series are re-estimated monthly when each new month's data becomes available. Figures are therefore subject to revision, with the largest changes normally occurring in the latest months.

The X-12-ARIMA seasonal adjustment program, developed at the U.S. Census Bureau, is used to produce the seasonally adjusted and trend estimates.

Trend estimates

Trend estimation removes the estimated impact of regular seasonal events and irregular short-term variation from statistical series. This reveals turning points and the underlying direction of movement over time.

The trend series are re-estimated monthly when each new month's data becomes available. Figures are therefore subject to revision, with the largest changes normally occurring in the latest months. Revisions can be large if values are initially treated as outliers but are later found to be part of the underlying trend.

The X-12-ARIMA seasonal adjustment program is used to produce the seasonally adjusted and trend estimates. Irregular short-term variation is removed by smoothing the seasonally adjusted series using optimal weighted moving averages.

Further information on [seasonal adjustment](#) is on the Statistics New Zealand website.

Trading day adjustments

An aim of time series analysis is to identify movements that are due to actual changes. Seasonal adjustment is done to remove systematic calendar-related variation. Specific adjustments can be made to remove variations due to trading day differences and moving holidays, such as Easter, which are not accounted for in a standard seasonal adjustment.

Some of the apparent movement in building consent figures is due to trading day differences between months. For example, a month with four weekends will have more trading or working days than a comparable month with five weekends. This can affect monthly figures, even though there might be no difference in the length of the month or difference in the rate at which consents are issued. Trading day effects, when estimated to be statistically significant, are quantified and removed. This is trading day adjustment.

Since 1998, trading day adjustments have been made to the building consents series during the seasonal adjustment process. Since May 2004, an improved method has been used. At present, there is no adjustment to remove the effect of moving holidays such as Easter.

Trend estimates versus month-on-month comparisons

Trend estimates reveal the underlying direction of movement in statistical series. In contrast, comparisons of unadjusted data between one month and the same month in the previous year/s do not take account of data recorded for the intervening months, and are subject to one-off fluctuations. Reasons for fluctuations include changes in legislation, economic variables such as interest rates, and trading day composition of months.
