

Household Labour Force Survey: December 2011 quarter

Embargoed until 10:45am – 09 February 2012

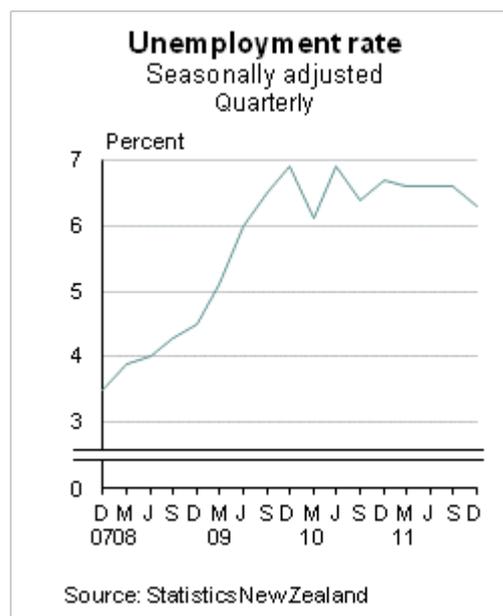

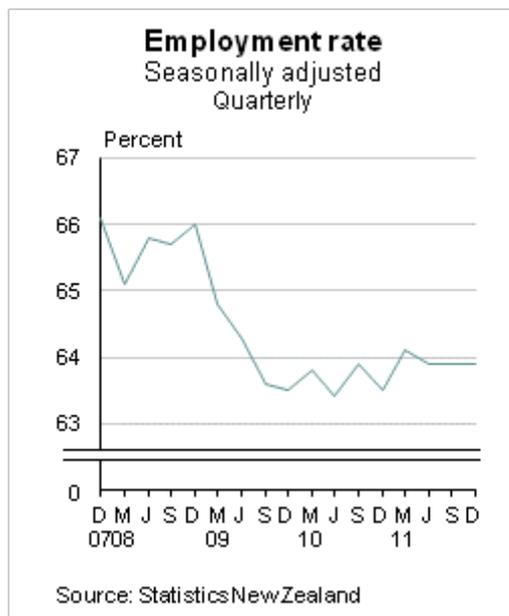

Key facts

In the December 2011 quarter compared with the September 2011 quarter:

- The unemployment rate fell 0.3 percentage points, to 6.3 percent.
- 7,000 fewer people were unemployed.
- 3,000 more people were employed.
- The employment rate was flat, at 63.9 percent.

All figures are seasonally adjusted.

	December 2011 quarter	Quarterly change	Annual change
	(Percent)	(Percentage points)	(Percentage points)
Unemployment rate	6.3	-0.3	-0.4
Employment rate	63.9	0.0	+0.4
Labour force participation rate	68.2	-0.2	+0.2
	(000)	(Percent)	
Unemployed	150	-4.2	-3.7
Employed	2,221	+0.1	+1.6
Not in the labour force	1,107	+1.0	+0.4

Commentary

- Unemployment rate falls but employment growth is slow
- Female unemployment falls
- Low employment growth
- Total hours worked decreases after sharp rise last quarter
- Lower labour force participation
- Canterbury still influencing national movements
- Proportion of youth not in employment, education, or training increases
- Longer time series

Unemployment rate falls but employment growth is slow

The **unemployment rate** fell 0.3 percentage points in the December 2011 quarter, down to 6.3 percent. The number of people unemployed decreased by 7,000.

The number of people employed rose by 3,000, while the **employment rate** remained at 63.9 percent. The flat employment rate highlights that the increase in employment is just keeping pace with the increasing size of the working-age population.

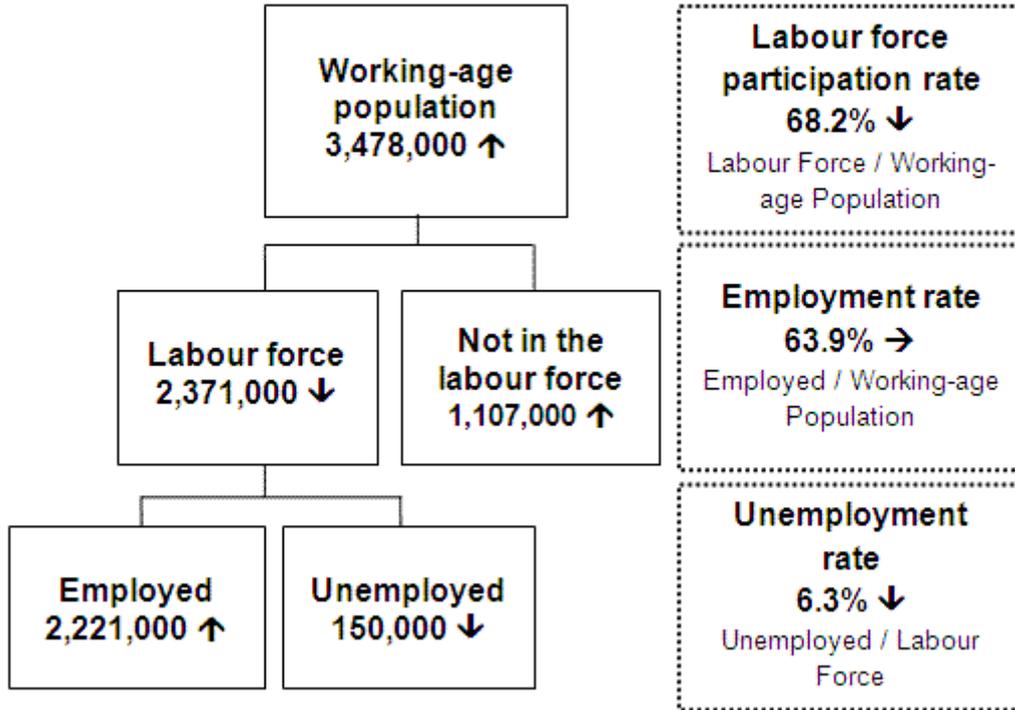

Over the quarter, **full-time employment** decreased by 13,000 (0.8 percent), while **part-time employment** increased by 15,000 (3.0 percent). The decrease in full-time employment followed a sharp increase in male full-time employment during the September 2011 quarter.

Similarly, the decrease in **actual hours worked** over the quarter followed a large increase in the September 2011 quarter. Both actual and usual hours worked fell in the December 2011 quarter. Actual hours worked fell 1.4 percent and usual hours worked fell 0.9 percent.

The **labour force participation rate** fell 0.2 percentage points over the quarter, down to 68.2 percent. This reflects a decrease of 3,000 people in the labour force and a corresponding increase of 11,000 in those not in the labour force.

In annual unadjusted terms, the Canterbury region has seen a significant decrease in the labour force participation rate since the December 2010 quarter. The Auckland region had significant increases in both the number of people employed and the employment rate.

The Labour Market December 2011 quarter Seasonally adjusted figures

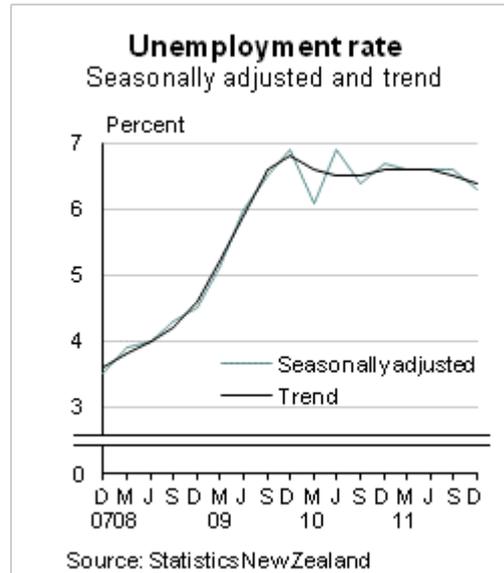

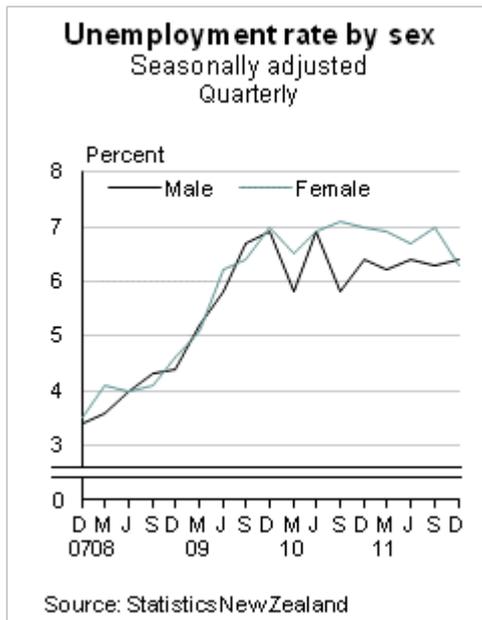

Female unemployment falls

In seasonally adjusted terms, unemployment decreased by 7,000 people (4.2 percent) during the December 2011 quarter.

This decrease reflected a fall of 8,000 (10.1 percent) in the number of women unemployed. In contrast, men in unemployment increased, with the number of men unemployed up 1,000 (1.6 percent).

As a result of the different labour market outcomes for men and women, the difference between male and female unemployment rates has decreased. The unemployment rate for women decreased 0.7 percentage points to 6.3 percent, while the male unemployment rate increased 0.1 percentage points to 6.4 percent. At 6.3 percent, the unemployment rate for women is the lowest female unemployment rate since the June 2009 quarter.

The trend series

The trend series shows unemployment decreased by 3,000 (2.0 percent), to 152,000 people in the December 2011 quarter. The sex difference was muted in comparison with the seasonally adjusted series, with male unemployment flat over the quarter and female unemployment decreasing by 3,000 (4.3 percent).

Refer to the [Data quality](#) section of this release for more information about trend series.

Unadjusted annual movements

In the year to December 2011, the unemployment rate for all people who identified with the Māori ethnic group (including those who may also have identified with other groups) remained flat, at 13.4 percent.

Low employment growth

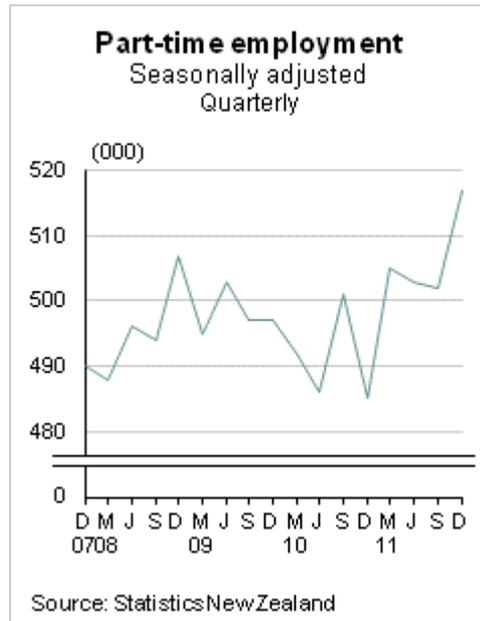

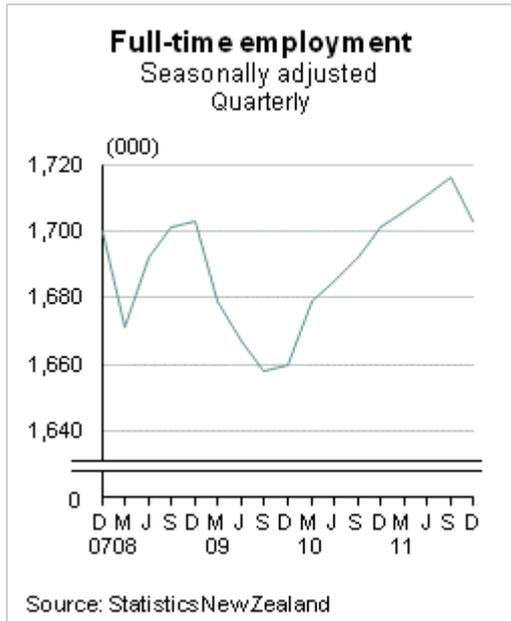

During the December 2011 quarter, seasonally adjusted employment increased by 3,000 people (0.1 percent) while the employment rate remained at 63.9 percent for the third consecutive quarter. This highlights that employment has been increasing at the same rate as the working-age population.

As with unemployment, there was a divergence between male and female employment over the quarter. The number of women employed increased by 7,000 (0.7 percent), while the number of men employed decreased by 4,000 (0.4 percent). The employment rate for women increased to 58.4 percent, while the male employment rate decreased to 69.7 percent.

Full-time employment decreased by 13,000 (0.8 percent) during the quarter. Over the same period, part-time employment increased by 15,000 (3.0 percent). The number of men in full-time employment fell 1.6 percent this quarter, while men in part-time employment rose 7.1 percent. The fall in male full-time employment followed a large rise in the September 2011 quarter. In contrast, the number of women in both full-time and part-time employment rose this quarter, up 0.4 percent and 1.5 percent, respectively.

Since the December 2010 quarter, employment has increased by 34,000 (1.6 percent). On an

annual basis, female employment increased more than male employment, up 19,000 and 15,000 people, respectively.

The trend series

Employment in the trend series saw an increase of 4,000 (0.2 percent) in the December 2011 quarter. Unlike the divergence seen in the male and female seasonally adjusted series, the trend series showed a rise in employment for both men and women.

Unadjusted annual movements

The 7.1 percent rise in male part-time employment was coupled with a 6.8 percent increase in the number of men underemployed over the December 2011 year. Over the same period, the number of women underemployed fell 2.0 percent. People who are underemployed are individuals who are in part-time employment and would prefer to work more hours.

The annual increase in the number of women employed was especially noticeable in the education and training industry. The total number of people employed in this industry saw a significant rise in employment over the year –19,400 people (10.8 percent).

During the December 2011 year, there were significant increases in employment for people aged 30–34 years, 50–54 years, 55–59 years, and those aged 65 years and over. In contrast, those aged 35–39 years had a significant decrease in employment.

Both the level of employment and the employment rate increased significantly in the Auckland region. The number of people employed in Auckland increased by 50,700 (7.6 percent), to 713,400 during the December 2011 year. Employment in the Tasman, Nelson, Marlborough, and West Coast region had a significant increase of 10,800 (12.3 percent), while the Gisborne and Hawke's Bay region had a significant decrease in employment of 7,400 (7.2 percent).

Total hours worked falls after sharp rise last quarter

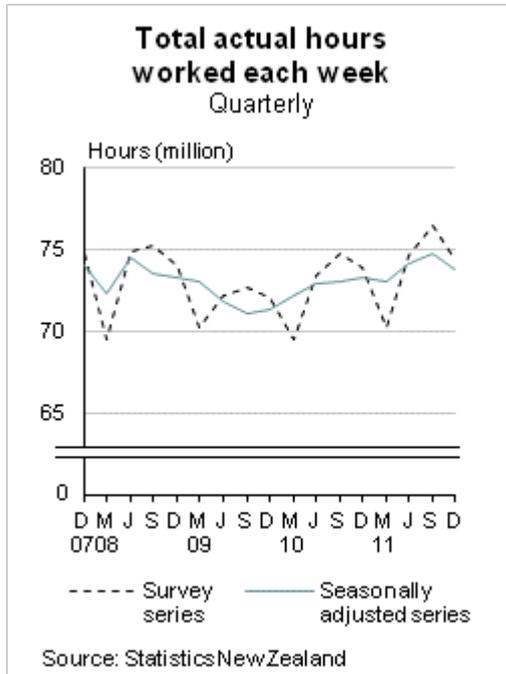

In seasonally adjusted terms, both the actual and usual hours worked decreased in the December 2011 quarter. The total number of actual hours worked fell 1.4 percent, to 73,776,000

hours, while the total number of usual hours fell 0.9 percent, to 79,673,000 hours.

A person's actual hours worked are the number of hours they worked in the reference week (including overtime). Usual hours worked are the number of hours a person normally works in a week (including overtime).

The decrease in actual hours was in part exaggerated by a sharp increase in actual hours in the September 2011 quarter. This was particularly apparent in the Auckland region.

The decrease in both actual and usual hours also reflected the fall in full-time employment and rise in part-time employment.

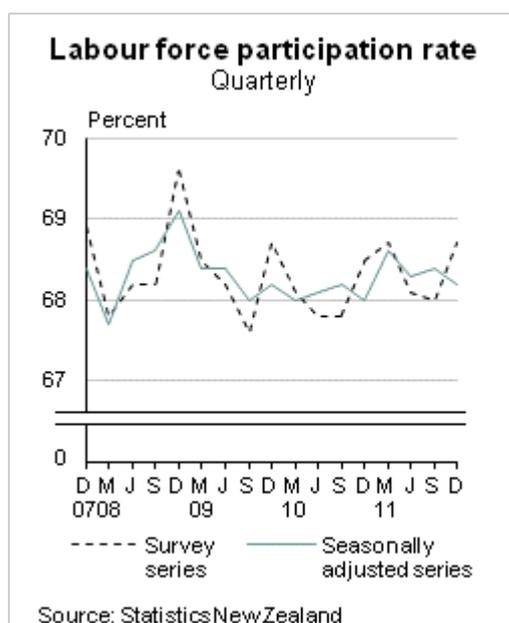

Lower labour force participation

Although the employment rate remained flat, at 63.9 percent, the seasonally adjusted labour force participation rate decreased by 0.2 percentage points to 68.2 percent during the December 2011 quarter. The labour force participation rates for both men and women decreased, by 0.4 and 0.1 percentage points, respectively.

In the December 2011 quarter, the number of people not in the labour force increased by 11,000 (1.0 percent). Men not in the labour force increased by a greater amount than women, up 8,000 (1.8 percent) and 3,000 (0.5 percent), respectively.

In unadjusted terms, those not in the labour force who are in education increased by 3,400 (1.4 percent) over the December 2011 year. The number of youth (people aged 15–24 years) who are not in the labour force but are in education increased by 8,600 (4.4 percent) during the year.

Since the December 2010 quarter, the labour force participation rate increased significantly for those aged 65 years and over, to reach 19.5 percent.

Canterbury still influencing national movements

Annually, the labour market in the Canterbury region is still showing very different movements to 'national excluding Canterbury' estimates.

Unadjusted annual changes for the December 2011 quarter			
	Annual change		
	Canterbury	National excluding Canterbury	National
Unemployment rate	-1.0	-0.2	-0.3
Employment rate	-1.9	+0.7	+0.4
Labour force participation rate	-2.7	+0.7	+0.2
Unemployed	-24.0%	+0.1%	-3.2%
Employed	-8.3%	+3.3%	+1.5%
Not in the labour force	+3.3%	-0.1%	+0.4%
Actual hours	-9.6%	+2.4%	+0.5%

Over the December 2011 year, the Canterbury region had a significant decrease in the labour force participation rate, down 2.7 percentage points to 68.0 percent. The labour force participation rate for 'national excluding Canterbury' increased, up 0.7 percentage points to 68.8 percent.

In the year to December 2011, the decrease in employment in Canterbury was mirrored in a decrease in both full-time and part-time employment. The drop in full-time employment was larger than that in part-time employment. By sex, the fall in employment for women was larger than that for men.

By industry, the largest fall in employment was in the retail trade, accommodation, and food services industry group, down 11,700 (20.6 percent). Most of this decrease was in the accommodation and food services part of this group. Employment in the construction industry decreased by 4,000 (13.4 percent) in Canterbury over the year, down from a 30,200 peak in the December 2010 quarter.

Although the Canterbury region had a decrease in the employment rate over the year, at 64.6 percent it is higher than that of both 'national excluding Canterbury' and New Zealand as a

whole. Likewise, at 5.0 percent, the Canterbury region's unemployment rate is still lower than both the 'national excluding Canterbury' and the national rates.

Supplementary tables with detailed data for the Canterbury region are included in this release. These are similar to tables 3, 4, 7, 8, 9, 11, and 14 from the main tables. Data in the tables for the Canterbury region are all unadjusted.

To view these tables, see the Excel tables in the 'Downloads' box.

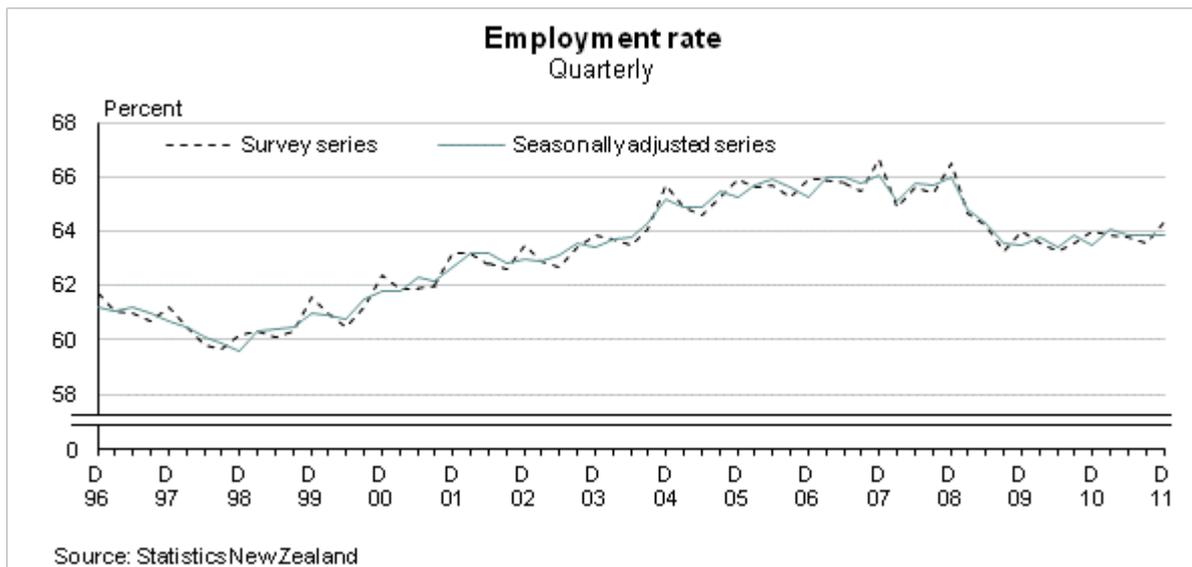

Proportion of youth not in employment, education, or training increases

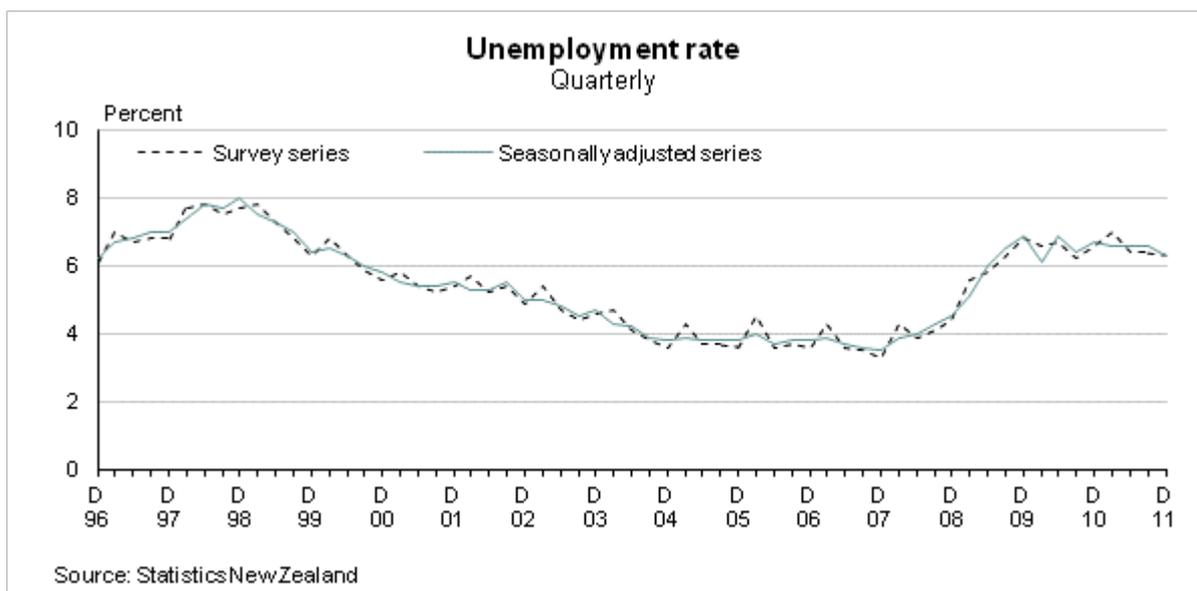

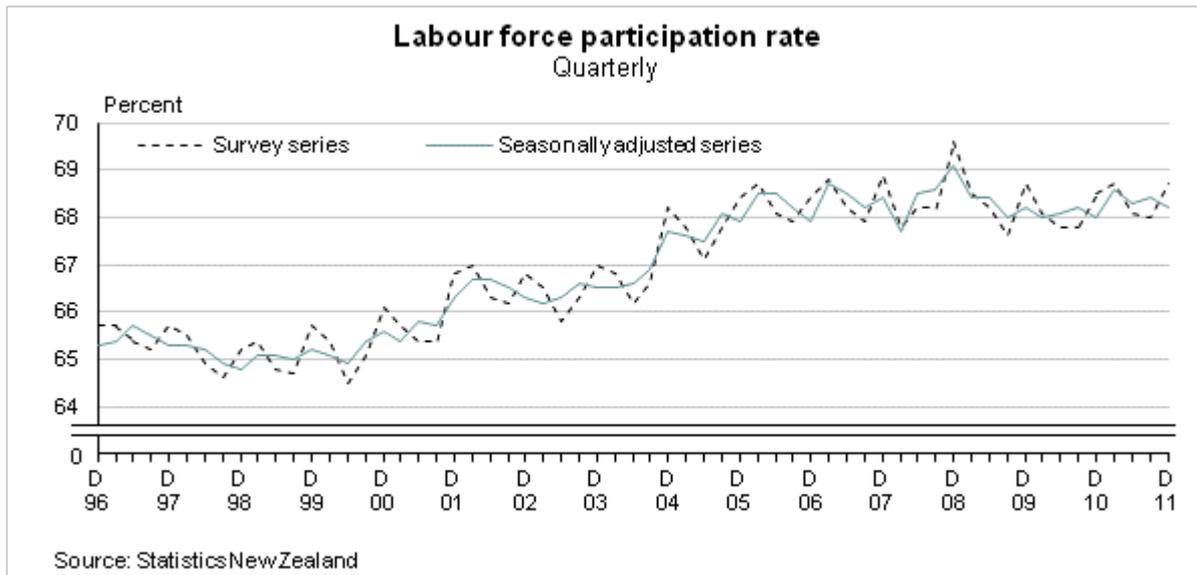

The youth (aged 15–24 years) not in employment, education, or training (NEET) rate has been introduced into the HLFS official estimates. The youth NEET rate is calculated as the total number of youth who are NEET as a proportion of the total youth working-age population. Refer to the [Data quality](#) section for more information.

In the December 2011 quarter, the seasonally adjusted youth NEET rate increased 0.7 percentage points, to 13.1 percent. The 15–19-years age group saw a larger increase than the 20–24-years age group, up 1.3 and 0.1 percentage points, respectively.

Longer time series

The following graphs show the HLFS series for the employment rate, the labour force participation rate, and the unemployment rate over a 15-year period. A complete time series from March 1986 onwards is available on request.

For more detailed data see the Excel tables in the 'Downloads' box.

September 2011 quarter estimates have been revised. For more information, see the [Revisions](#) section.

Definitions

About the Household Labour Force Survey

The Household Labour Force Survey (HLFS) started in October 1985 and the first results published were for the March 1986 quarter. The survey provides a regular, timely, and comprehensive portrayal of New Zealand's labour force.

Each quarter, Statistics New Zealand produces a range of statistics relating to employment, unemployment, and people not in the labour force.

More definitions

The labour force category to which a person is assigned depends on their actual activity during a survey reference week.

This section includes definitions used in the HLFS release. These conform closely to the international standard definitions specified by the International Labour Organization.

Working-age population: the usually resident, non-institutionalised, civilian population of New Zealand aged 15 years and over.

Labour force: members of the working-age population, who during the survey reference week, were classified as 'employed' or 'unemployed'.

Labour force participation rate: the total labour force expressed as a percentage of the working-age population. Labour force participation is closely linked to how the working-age population is defined. See [Data quality](#) for more details about how the labour force participation rate used in this release is calculated.

Employed: people in the working-age population who, during the reference week, did one of the following:

- worked for one hour or more for pay or profit in the context of an employee/employer relationship or self-employment
- worked without pay for one hour or more in work which contributed directly to the operation of a farm, business, or professional practice owned or operated by a relative
- had a job but were not at work due to: own illness or injury, personal or family responsibilities, bad weather or mechanical breakdown, direct involvement in an industrial dispute, or leave or holiday.

Employment rate: the number of employed people expressed as a percentage of the working-age population. The employment rate is closely linked to how the working-age population is defined. See [Data quality](#) for more details about how the employment rate used in this release is calculated.

Unemployed: all people in the working-age population who during the reference week were without a paid job, available for work, and had either actively sought work in the past four weeks ending with the reference week, or had a new job to start within the next four weeks.

Unemployment rate: the number of unemployed people expressed as a percentage of the labour force.

Jobless: people who are either officially unemployed, available but not seeking work, or actively seeking but not available for work. The 'available but not seeking work' category is made up of the 'seeking through newspaper only', 'discouraged', and 'other' categories.

Not in the labour force: any person in the working-age population who is neither employed nor unemployed. For example, this residual category includes people who:

- are retired
- have personal or family responsibilities such as unpaid housework and childcare
- attend educational institutions
- are permanently unable to work due to physical or mental disabilities
- were temporarily unavailable for work in the survey reference week
- are not actively seeking work.

Hours worked: actual hours are the number of hours a person worked in the reference week (including overtime). Usual hours refers to the number of hours a person normally works in a week (including overtime).

Full-time/part-time status: full-time workers are those who usually work 30 hours or more per week, even if they did not do so in the survey reference week because of sickness, holidays, or other reasons. Part-time workers are those who usually work fewer than 30 hours per week.

Underemployment: employed people who work part time (ie usually work less than 30 hours in all jobs) and would prefer to work more hours.

Formal study statistics: to be participating in formal study, a person must be working towards a qualification that takes three or more months of full-time study to complete. Full-time study is defined as 20 or more hours per week.

Young people not in employment, education, or training (NEET): young people aged 15–24 years who are unemployed (part of the labour force) and not engaged in education or training, and those not in the labour force and not engaged in education or training for many reasons.

For more information on these definitions please refer to [Labour force categories used in the Household Labour Force Survey](#).

Period-specific information

Sampling errors for the December 2011 quarter

From the December 2011 quarter onwards the way we calculate sampling errors has changed – from a model-based approach to a jackknife method. The jackknife method is based on the variation between estimates, based on different subsamples taken from the whole sample. This is an attempt to see how estimates would vary if we were to repeat the survey with new samples of individuals.

Ethnic statistics

From the December 2011 quarter, the Household Labour Force Survey (HLFS) publishes ethnicity data using the total response ethnicity output. Using this method, people who reported that they belonged to more than one ethnic group are counted once in each group reported. This means that the total number of responses for all ethnic groups can be greater than the total number of people who stated their ethnicities.

An alternate method of classifying ethnicity is using the single/combination output method. Using the single/combination ethnicity output, people are counted just once according to the ethnic group or combination of ethnic groups they have reported. This means that the total number of responses equals the total number of people who stated an ethnicity. The table below shows single/combination data for the working-age population for the September 2011 and December 2011 quarters of the HLFS.

Single/combination HLFS ethnicity data for working-age population		
Ethnic group	September 2011 quarter	December 2011 quarter
European only	2,348,000	2,366,700
Māori only	250,600	249,400
Pacific peoples only	169,700	163,700
Asian only	355,100	356,500
MELAA only ⁽¹⁾	32,000	28,900
Other ethnicity only	70,500	67,300
European/Māori	168,200	169,600
Two or more groups not elsewhere included	63,100	65,00
Residual categories	9,500	9,100
Total all ethnic groups	3,466,600	3,476,000
1. MELAA = Middle Eastern/Latin American/African.		

See the [2005 New Zealand standard classification of ethnicity](#) for more information.

School holidays (secondary school)

The term times for the 2011 school year were altered to accommodate the Rugby World Cup tournament. Keep this in mind when making annual comparisons.

	2010	2011
Term 1	2 February – 1 April	31 January – 15 April
Term 2	19 April – 2 July	2 May – 15 July
Term 3	19 July – 24 September	1 August – 7 October
Term 4	11 October – 14 December	25 October – 13 December

General information

Data source

The target population for the HLFS is the civilian, usually resident, non-institutionalised population aged 15 years and over.

The statistics in this release **do not** cover:

- long-term residents of homes for older people, hospitals, and psychiatric institutions
- those living in non-private dwellings (eg hotels, motels, hostels)
- inmates of penal institutions
- members of the permanent armed forces
- members of the non-New Zealand armed forces
- overseas diplomats
- overseas visitors who expect to be resident in New Zealand for less than 12 months
- those aged under 15 years
- people living on offshore islands (except Waiheke Island).

Accuracy of the data

Sample design

The HLFS sample contains about 15,000 private households and about 30,000 individuals each quarter. We sample households on a statistically representative basis from areas throughout New Zealand, and obtain information for each member of the household. The sample is stratified by geographic region, urban and rural areas, ethnic density, and socio-economic characteristics.

Households stay in the survey for two years. Each quarter, one-eighth of the households in the sample are rotated out and replaced by a new set of households. Therefore, up to seven-eighths of the same people are surveyed in adjacent quarters. This overlap improves the reliability of quarterly change estimates.

The period of surveying/interviewing is 13 weeks. The information obtained relates to the week before the interview (referred to as the 'survey reference week'). We first interview respondents face-to-face at their home. Subsequent interviews are by telephone wherever possible. Respondents also have the option to file self-completed questionnaires.

Where practicable, we obtain information directly from each household member. Otherwise a proxy interview is conducted, in which details are obtained from another adult in the household.

Sampling errors

Sampling errors can be measured. They quantify the variability that occurs by chance because a sample rather than an entire population is surveyed.

We calculate sampling errors for each cell in the published tables and for estimates of change between adjacent quarters. For example, the estimated total number of people employed in the December 2011 quarter is 2,237,000 before seasonal adjustment. This estimate is subject to a sampling error of plus or minus 24,100, or 1.1 percent (measured at the 95 percent confidence level). This means that there is a 95 percent chance that the true number of employed people lies between 2,212,900 and 2,261,100.

Smaller estimates, such as the number of people who are unemployed, are subject to larger relative sampling errors than larger estimates. For example, the estimated total number of people unemployed in the December 2011 quarter is 150,700 before seasonal adjustment. This estimate is subject to a sampling error of plus or minus 11,600 or 7.7 percent (measured at the 95 percent confidence level). This means that there is a 95 percent chance that the true number of unemployed people lies between 139,100 and 162,300.

Estimates of change are also subject to sampling error. For example, the survey estimate of change in total employment from the December 2010 quarter to the December 2011 quarter is an increase of 34,100. This estimate is subject to a sampling error of plus or minus 24,600 (at the 95 percent confidence level). Therefore, the true value of the change in surveyed employment from the December 2010 quarter to the December 2011 quarter has a 95 percent chance of lying between 9,500 and 58,700.

A change in an estimate, either from one adjacent quarter to the next, or between quarters a year apart, is said to be statistically significant if it is larger than the associated sampling error. Therefore, the example quoted above represents a significant movement.

In general, the sampling errors associated with subnational estimates (eg breakdowns by regional council area or ethnic group) are larger than those associated with national estimates.

A non-sampling error is very difficult to measure, and if present can lead to biased estimates. Statistics New Zealand endeavours to minimise the impact of these errors by applying best survey practices and monitoring known indicators (eg non-response).

Suppression of data

Cells with estimates of less than 1,000 are suppressed and appear as 'S' in the tables. These estimates are subject to sampling errors too great for most practical purposes.

Response rates

The target response rate for the HLFS is 90 percent. The response rate is calculated by determining the number of eligible households that responded to the survey, as a proportion of the estimated number of total eligible households in the sample. The following table shows the HLFS response rates for the last five quarters.

HLFS response rates	
Quarter	National response rate (percent)
December 2010	87.7
March 2011	84.3
June 2011	87.2
September 2011	88.2
December 2011	88.8

Seasonal adjustment and trend series

In the labour market, cyclical events that affect labour supply and demand occur around the same time each year. For example, in summertime a large pool of student labour is both available for, and actively seeking, work. Demand for labour in the retail sector and in many primary production industries also increases.

For any series, the estimates can be broken down into three components: trend, seasonal, and irregular. Seasonally adjusted series have had the seasonal component removed. Trend series have had both the seasonal and irregular components removed, and reveal the underlying direction of movement in a series.

The series for each labour market statistic is adjusted separately. For this reason, the sum of the seasonally adjusted estimates for employment, unemployment, and people not in the labour force will usually not add up to the working-age population estimates.

See [Seasonal adjustment in Statistics New Zealand](#) for more information about how we seasonally adjust our statistics. Seasonal adjustment makes data for adjacent quarters more comparable by smoothing out the effect on the time series of any regular seasonal events. This ensures that the underlying movements in the time series are more visible. All seasonally adjusted and trend series are produced using the X-12-ARIMA Version 0.2.10 package developed by the U.S. Census Bureau.

Quality of seasonal adjustment

We monitor our data to make sure that our seasonal adjustment is robust.

The X-12-ARIMA programme is highly customisable and can produce a wide variety of possible adjustments for any particular input series. Consequently, X-12-ARIMA produces a number of diagnostics which are useful in assessing the quality of the chosen adjustment.

The following table provides a selection of diagnostics. The reference value provides an indication of the desired value for each. Most are acceptable, though there is evidence of a changing seasonal pattern for the number of males who are unemployed and females who are not in the labour force. More detail about seasonal adjustment in the HLFS is available upon request.

Seasonal adjustment diagnostics							
	Reference value	Male employed	Female employed	Male unemployed	Female unemployed	Male not in labour force	Female not in labour force
Test for seasonality	<0.10	0.00	0.00	0.00	0.00	0.00	0.00
Test for moving seasonality	>0.10	0.22	0.66	0.02	0.30	0.73	0.04
Periods until trend dominates	<3	1	1	1	2	2	2
Trend contribution to change	<20	31.84	41.16	46.99	14.97	12.30	20.54
Seasonal contribution to change	>50	58.75	41.78	36.91	67.79	76.08	52.38
Irregular contribution to change	<20	9.42	17.06	16.10	17.25	11.62	27.08
Quality statistic	<1	0.42	0.53	0.77	0.697	0.64	0.91

Outliers

During the seasonal adjustment process, X-12-ARIMA can give less weight to the irregular component. Specifically, if the estimated irregular component at a point in time is sufficiently large compared with the standard deviation of the irregular component as a whole, then the irregular component at that point can be downweighted or removed completely and re-estimated. Such observations are referred to as partial and zero-outliers, respectively. In practice, the downweighting of outliers will do little to seasonally adjusted data, but the impact of the outliers on the trend series will generally be reduced. However, if an outlier ceases to be an outlier as more data becomes available, then significant revisions to the trend series become possible. There are no outliers present over the last four quarters of data.

Revisions

Each quarter, the seasonal adjustment process is applied to the latest quarter and all previous quarters. This means that seasonally adjusted estimates for any of the previously published quarters may change slightly. The following table lists the change in estimates between the current and previous publication for the seasonally adjusted data. For example, the seasonally

adjusted number of males employed for the September 2011 quarter was 1,184,000. In the December 2011 quarter release, that same estimate has been revised to 1,183,000. These numbers are rounded to the nearest 1,000, but the relative change derived from the unrounded estimates is a downward revision of 0.08 percent.

Percent revision from last published, seasonally adjusted						
Quarter	Male employed	Female employed	Male unemployed	Female unemployed	Male not in labour force	Female not in labour force
Dec 2010	0.09	-0.01	-1.43	-0.08	-0.14	0.00
Mar 2011	-0.03	0.01	0.66	0.06	0.05	0.00
Jun 2011	0.01	-0.03	0.33	0.56	-0.05	0.00
Sep 2011	-0.08	0.04	0.54	-0.44	0.17	-0.02

The following table presents information on how the trend estimates have been revised. Trend revisions are generally larger than those of the seasonally adjusted data.

Percent revision from last published, trend						
Quarter	Male employed	Female employed	Male unemployed	Female unemployed	Male not in labour force	Female not in labour force
Dec 2010	0.02	0.01	-0.43	-0.23	-0.02	0.00
Mar 2011	0.02	-0.01	-0.23	0.24	-0.05	0.00
Jun 2011	0.03	0.00	0.51	0.86	-0.10	-0.07
Sep 2011	-0.18	0.18	0.42	-2.22	0.34	-0.09

Every estimate is subject to revision each quarter as new data is added, though in practice estimates more than two years from the end-point will change little. For example, the trend estimate of male employment for the December 2010 quarter was 1,167,000 when first published. In the December 2011 quarter, one year later, the trend estimate of male employment for the December 2010 quarter is 1,170,000, an increase of 3,000 (or an increase 0.27 percent using the unrounded estimates). This is an example of a '4-step ahead' revision. The table below shows the average of all such absolute revisions expressed relatively and gives some indication of how much the current estimates might be revised when the March 2012 data becomes available.

Mean absolute percent revisions				
	Seasonally adjusted		Trend	
	1-step	4-step	1-step	4-step
Male employed	0.05	0.09	0.16	0.17
Female employed	0.07	0.12	0.27	0.28
Male unemployed	0.45	0.71	1.64	1.73
Female unemployed	0.53	0.98	1.92	1.89
Male not in labour force	0.09	0.18	0.36	0.38
Female not in labour force	0.09	0.15	0.36	0.39

Rounding procedures

Figures presented in this release are rounded. Figures are rounded to the nearest hundred or to the nearest thousand for seasonally adjusted and trend estimates. This may result in a total disagreeing slightly with the sum of the individual items as shown in the table. Where figures are rounded the unit is shown as (000) for thousands.

How labour force statistics are classified

The HLFS release includes specific statistics about industry, occupation, study, ethnicity, and region. This section defines what we measure for each of these statistics.

Industry statistics

Since the September 2009 quarter, the industry statistics are based on the Australian and New Zealand Standard Industrial Classification 2006 (ANZSIC06), the latest edition of the classification. When ANZSIC06 was introduced, Statistics NZ developed the New Zealand Standard Industrial Output Categories (NZSIOC). Classifying industries using NZSIOC helps to standardise outputs. Industry outputs defined using ANZSIC06 are not comparable with those based on ANZSIC96, the version used before the September 2009 quarter.

See [Implementing ANZSIC 2006 in the Household Labour Force Survey](#) for more information.

Occupation statistics

Since the September 2009 quarter, we have used the Australian and New Zealand Standard Classification of Occupations (ANZSCO) to classify occupation data in the HLFS. ANZSCO is a harmonised classification developed by Statistics NZ, the Australian Bureau of Statistics, and the Australian Department of Employment and Workplace Relations, for use in both Australia and New Zealand. Occupation data was previously based on the New Zealand Standard Classification of Occupations 1999 (NZSCO99). The occupation data is available on [Infoshare](#).

See [Implementing ANZSCO in the Household Labour Force Survey](#) for more information.

Māori benchmarks

Before April 2009, we did not benchmark the Māori working-age population to population estimates. This, along with other sample design restrictions, caused a high degree of volatility in Māori statistics in the HLFS. Movements in the working-age population estimates of certain ethnic groups, such as Māori, may reflect this volatility rather than a real change in the estimated ethnic demographic. Including Māori benchmarks in the working-age population mitigates the known undercount of Māori in the HLFS and also results in smoother time series for Māori statistics in the HLFS. However, introducing the Māori population benchmarks does not necessarily translate to improved estimates for non-Māori ethnic groups.

Household statistics

A household's labour force status is derived by looking at the labour force status of household members aged 18–64 years. For example, if a couple is living by themselves and one is aged 64 years and the other is aged 65 years, this couple will be assigned to the 'All employed' or 'None employed' category, depending on the labour force status of the 64-year-old.

Households that have no members aged 18–64 years are excluded from this analysis. The

household categories incorporate the concept of dependent children rather than just children. A child is a person of any age who usually resides with at least one parent (natural, step, adopted, or foster) and who does not usually reside with a partner or child(ren) of his or her own. Statistics NZ defines a dependent child as a child aged less than 18 years and not in full-time employment.

Updated regional classification

In November 2010, the new Auckland territorial authority replaced the existing Rodney district, North Shore city, Auckland city, Waitakere city, Manukau city, Papakura district, and part of Franklin district councils. This resulted in a minor change in the boundary between the Auckland and Waikato regions.

From the June 2011 quarter, the statistics in the HLFS release were produced using the new boundaries and backcast for the March 2011 quarter. The new boundaries do not significantly affect measures from the HLFS.

Comparability with other datasets

See [Comparing our labour market statistics](#) for more information on how the HLFS compares with the other labour market statistics that we produce. This page explains which measures of employment are included in each of our employment releases, and the timings and coverage of each release.

See [A Guide to Unemployment Statistics](#) for more information on comparing the HLFS with other datasets on unemployment. This page explains which measures of unemployment are included in the HLFS, the unemployment benefit, and the job-seekers register. It also includes information on the timings, coverage, and different purposes of each of these measures.

International comparability of the labour force participation rate and the employment rate

Several alternative definitions of labour force participation rate and employment rate are used by other organisations and countries; they differ in the age of the working-age population and the inclusion of military personnel. A common definition is to restrict the labour force and working-age population to the 15–64-year age group, particularly in countries with a compulsory retirement age. Generally, this definition leads to a higher labour force participation rate and employment rate. Using this definition for the New Zealand HLFS in the December 2011 quarter gives a surveyed figure of 78.2 percent (labour force participation rate) and 73.1 percent (employment rate).

Interpreting the data

Information releases contain seasonally adjusted, trend, and survey statistics for the latest quarter. These statistics are averages for the three-month period and do not apply to any specific point in time. Data sourced from the seasonally adjusted series and trend series are identified as such in the table or section headings. All other data, in the commentary or in tables, are sourced from the original survey series and are unadjusted.

Timing of published data

The HLFS is published within six weeks after the end of the quarter's reference period.

Confidentiality

Only people authorised by the Statistics Act 1975 are allowed to see your individual information, and they must use it only for statistical purposes. Your information is combined with similar information from other people or households to prepare summary statistics.

More information

For more technical information, see [Information about the Household Labour Force Survey](#).

Liability

While all care and diligence has been used in processing, analysing, and extracting data and information in this publication, Statistics NZ gives no warranty it is error-free and will not be liable for any loss or damage suffered by the use directly, or indirectly, of the information in this publication.

Timing

Timed statistical releases are delivered using postal and electronic services provided by third parties. Delivery of these releases may be delayed by circumstances outside the control of Statistics NZ. Statistics NZ accepts no responsibility for any such delays.

Revisions

Revision of Māori benchmarks

The benchmarks for the Māori working-age population used in the September 2011 quarter have been revised. A minor error was found, which resulted in overstated Māori benchmarks. Hence, data released in the September 2011 quarter has been revised in the December 2011 quarter release.

At the aggregate level these changes had a small effect on the data – for example, the number of people employed increased by 200. The number of Māori employed decreased by 1,900 while the employment rate decreased by 0.1 percentage points to 57.3 percent. The labour force participation rate remained unchanged.

Tables

The following tables are included with this release. They are available in Excel format from the 'Downloads' box of *Household Labour Force Survey: December 2011 quarter* on the Statistics NZ website.

If you do not have access to Excel, you may use the [Excel file viewer](#) to view, print, and export the contents of the file.

1. People employed, unemployed, and not in labour force, by sex, seasonally adjusted series
2. People employed, unemployed, and not in labour force, by sex, trend series
3. People employed, unemployed, and not in labour force, by sex
4. People employed, unemployed, and not in labour force, by age group
5. People employed, unemployed, and not in labour force, by ethnic group
6. People employed, unemployed, and not in labour force, by regional council area
7. People employed, by industry and sex
8. The jobless: those without a job and wanting a job, by sex
9. Total actual hours worked
10. Household composition, by household labour force status
11. Underemployment, by sex
12. People employed, unemployed, not in the labour force, and total actual hours worked, seasonally adjusted series
13. Harmonised unemployment rates in OECD countries, latest available
14. People employed, unemployed, and not in labour force, by sex and formal study status
15. Labour force and education status of those aged 15–24, seasonally adjusted

Supplementary tables

The following tables provide unadjusted statistics for the Canterbury region and can be downloaded from the Statistics NZ website in Excel format.

1. People employed, unemployed, and not in labour force in Canterbury, by sex
2. People employed, unemployed, and not in the labour force in Canterbury, by age group
3. People employed in Canterbury, by industry and sex
4. The jobless: those without a job and wanting a job in Canterbury, by sex
5. Total actual and usual hours worked in Canterbury only
6. Underemployment in Canterbury, by sex
7. People employed, unemployed, and not in labour force in Canterbury, by sex and formal study status

A longer time series of the supplementary tables is available on request.
